Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Adamou JE, Choi GH;

WPI; 2001-112197/12. N-PSDB; AAC84742. New vaccines comprising Sp128 or Sp130 polypeptides, for treating and preventing pneumococcal infections, particularly infections caused by Streptococcus, e.g. otitis media, nasopharyngeal, bronchial, lung or blood infections.

Claim 8; Page 51-54; 54pp; English.

The invention relates to novel immunogenic polypeptides, Sp128 and Sp130 from S. pneumoniae. Vaccines comprising the polypeptides are useful for the treatment and prevention of pneumococcal infections, particularly infections caused by Streptococcus, such as otitis media, nasopharyngeal, bronchial, lung or blood infections. The antigens are used as immunogenic agents to stimulate an immune response. The antisera and antibodies may also be used in diagnosing and treating pneumococcal infections. Recombinant polypeptides serve as a mechanism for stimulating production of antibodies for use in passive immunotherapy, diagnostic reagents, and

   This sequence represents a Streptococcus pneumoniae protein of the invention. The proteins (or their homologues, derivatives and/or fragments) are useful as immunogens or antigens. Immunogenic or antigenic compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or diagnosts of S. pneumoniae infection, by contacting a sample to be tested with them. Agents capable of antagnosis of interfering with the function or expression of the protein or polypeptide are useful in medical compositions in the treatment or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, they can be used to treat bacterial pneumonia, which has high rates young children, the elderly, and in patients with predisposing conditions such as asplenia, heart, lung and kidney disease, diabetes, alcoholism,

   New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or ear infection.
  The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein. DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides 8-100 of a sequence not defined in the specification, for amplifying a target

contained within a Streptococcus nucleic acid sequence, where the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the complement of the target sequence, and where the parts of the primers having substantial complementarity define the termini of the target sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, otitis media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying immunodominant proteins. The present sequence is one of the 2469 proteins expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Estandardise OS field)

This invention relates to novel nucleic acids encoding hyperimmune serum reactive antigens, or fragments derived thereof. Specifically, it refers to antigens selected from peptides and serum reactive epitopse that can be used in pharmaccutical compositions that exhibit antibacterial activity. The present invention describes a composition (including the nucleic acid molecule, hyperimmune serum-reactive antigen or antibody) that is useful for manufacturing a medicament such as a vaccine, which can be used to treat or prevent barterial infections, particularly S. pneumoniae infections that cause pharyngitis, otitis media, pneumonia, bacteraemia sepais and meningitis. The antigen or its fragment may also be used for isolating, purifying and/ or identifying an interaction partner of the hyperimmune serum reactive antigen, as well as for manufacturing a functional modeic acid selected from aptemers and selected from ribozymes, antisense nucleic acid selected from the proposition sequence is a Streptococcus pneumoniae hyperimmune serum reactive antigen

The present sequence represents a protein from Streptococcus pneumoniae.

The nucleic acid sequence encoding the Streptococcus pneumoniae protein

can be useful in vaccines for inducing protective antibodies against

Streptococcus pneumoniae, for inducing protective antibodies against

Streptococcus pneumoniae, for treatment or prevention of infection e.g.

media or meningitis. Probes based on the nucleic acid

are used to detect Streptococcus infection (by usual hybridisation or

amplification methods), also for isolating Streptococcus genes or their

allelic variants. The protein can be used similarly to detect specific

antibodies in standard immunossays, especially for diagnosing or

monitoring infections. Antibodies which bind the protein are used to

detect corresponding antigens, to purify the protein and for passive

immunisation (optionally coupled to a toxin). Vaccines are administered,

e.g. by injection, orally or through the skin, typically at 0.01-1000

The invention relates to an isolated polynucleotide consisting of a Streptococcus pneumoniae nucleic acid (appearing as ADC45122 and encoding Spt28) one of 113 disclosed nucleic acids encoding 113 S. pneumoniae antigens. Also included are making a recombinant vector by inserting the nucleic acid into a vector, an isolated polynucleotide consisting of at recombinant host cell comprising the SP028 nucleic acid, and a recombinant host cell comprising the SP028 polynucleotide. The nucleic acids are useful as DNA vacaine against Streptococcus pneumoniae infection (e.g. pneumonia). Nucleic acids derived from the S. pneumoniae antigen nucleic acids are useful as probes for use in diagnostic methods for detecting S. pneumoniae gene expression. The present sequence represents an S. pneumoniae antigenic protein.

   ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP31514 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life or or continuit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site

  AAH52304 to AAH53970 represent mucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and ill) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH55091 to AAH55091 represent oligonalclocities sequences and primers which are used in the exemplification of the present invention. N.B. The present invention specifically claims all the polynuclectide sequences given in the exemplification of the present specification, however the sequence listing only goes up to SEQ ID NO:4455 to 4472, no sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present

The present invention relates to the protection against malaria. More particularly, the invention pertains to a family of MSP-3 (merozoite surface protein 3)-like genes (MSP-3-1, MSP-3-2, MSP-3-3, MSP-3-4, MSP-3-5, MSP-3-6, MSP-3-7 and MSP-3-8) located on chromosome 10 of Plasmodium falciparum, highly conserved in P. falciparum strains, simultaneously proteins which have a Asn-Ieu-Arg-Asn or Asn-Leu-Arg-Lys signature at their N-terminal extremity and which are located at the merozoite their N-terminal extracterization of this gene family enables the definition of immunogenic and waccine compositions against P. falciparum. The present sequence is the P. falciparum MSP-3-1 protein.

of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70018 to AAA7027 and AAB18144 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the

The present invention relates to a method for identifying candidate proteins in pathogen useful as anti-infectives. The invention discloses a computational method which involves the calculation of several sequence attributes and their subsequence analysis results in the identification of outlier proteins in different pathogens. The method is useful for the identification of outlier proteins (e.g. virulence proteins, antigens or proteins used as drug targets) in pathogenic organisms. The method of the invention provides reproducible results as it does not despend on the variable biochemical characterisation of proteins. ABO21500-ABO223617 represent outlier proteins identified from different pathogenic organisms

New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved biological characteristics.

Claim 2; SEQ ID NO 6262; 14pp; English.

The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) moiety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID Noi.2) and a Merozoite aurface protein 3 (MSP3) moiety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No.2) wherein the chimeric molecule raises antibodies against both polypeptides in mice immunicated with it. Also described are: (1) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (ii) an immunogenic composition compositiant the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine against malaria comprising the chimeric molecule, the conjugate described and/or recombinant anti-MSP3 and anti-GLURP antibodies, (iv) use of purified and/or recombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a metibodies. The chimeric molecule of the invention or a mixture of GLURP and (v) a medicament for passive malaria, comprising the anti-MSP3 and anti-GLURP antibodies. The chimeric molecule of the invention or a vaccine composition and MSP3 antigens as a mixture of GLURP and SSP3 fragment. Note: The present engreence playen as SQ ID No:7 in the Sequence Listing is not mentioned elsewhere in the specification. **XXXEX** 

The present invention describes an isolated and/or purified Plasmodium falciparum (malaria parasite) antigen polynucleotide sequence, encoding con immunogenic peptide. Also described: (1) a primer or detection probe for an immunogenic peptide. Also described by primer or detection probe for hybridisation with a target sequence or the amplicon generated from a target sequence comprising a sequence of at least 8-30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 90, 95 or 100 consecutive nucleotides of any of the polynucleotide sequences described above; (2) a DNA chip comprising a promoter operably linked to any of the nucleic acid sequences described above; (4) a host cell transformed by the vector of carrier and the polynucleotide described above; (5) a composition comprising a carrier and the polynucleotide described above; (5) a method of inducing an immune response in an individual comprising the administration of inducing an immune response; (7) an isolated comprising any of the amino acid sequences as encoded by the collypeptide comprising contacting a biological samples, comprising contacting a biological sample with the comprision of the isolated polynucleotides with nucleic acids contained in the sample; (10) a method of collogical samples, comprising contacting a biological sample with the comprision of the isolated deficiting an immune response in an individual; comprising the ciditing an immune response in the individual; (11) an composition comprising the polypeptides of (7); candividual to induce an immune response in the individual; (11) an composition composition comprising the polypeptides of (7); and detecting the polypeptide of (7); and detecting the polypeptides of (7); and an individual to induce an immune response in the individual; (11) and composition composition of a composition composition of a composition composition of a composition composition of a composition composition of a composition composition of a composition composition of a composition composition of a composition composition of 10; the sample. The P. falciparum antigens and immunogenic peptides have cytostatic, anti-HIV, virucide, hepatotropic and antibacterial carcivities, and can be used in vaccines. The methods and compositions of the present invention are useful for inducing an immune response for the prevention and/or treatment of carcer and infectious diseases, such as This, hepatitis, and bacterial infections. The present sequence represents a P. falciparum antigen amino acid sequence, which is used in the exemplification of the present invention. Plasmodium falciparum; malaria parasite; antigen; malaria; immunogenic; immune response; cytostatic; anti-HIV; virucide; hepatotropic; antibacterial; vaccine; cancer; infectious disease; AIDS; hepatitis; New isolated and/or purified Plasmodium falciparum polynucleotide sequences, useful in inducing an immune response for preventing and/or treating cancer and infectious diseases, such as AIDS, hepatitis, and Gaps 68; 11.7%; Score 105; DB 8; Length 1791; 23.7%; Pred. ```
the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a call. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated on the fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation; (9) pathway in which a proliferation cellular proliferation of an egene on which the test compound that inhibits proliferation of an

oppound's activity; finite curies and comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of errains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for callular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fitte. WIPO at the brown propound is not patent directly from WIPO at the propound of the printed specification, but was obtained ftp. wipo.int/pub/published_pct_sequences

The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) molety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozoite curface protein 3 (MSP3) molety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises antibodies against both polypeptides in mice immunized with it. Also clescribed abore it i) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (ii) an immunogenic composition comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or recombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a mixture of malaria, comprising the anti-MSP3 and anti-GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP and MSP3 antigens are useful for the preparation of a vaccine composition against malaria. This sequence represents Plasmodium falciparum MSP3 protein (amino acid residues 212-380).

The present sequence is that of a Staphylococcus aureus protein ORF0657n hybrid polypeptide denoted 0657nHybrid3. This is an example of claimed hybrid polypeptide immunogens of the invention ADW88439-ADW88474 that comprise a modified S. aureus ORF0657n sequence ADW88433-ADW88438 Containing amino acid substitutions that increase sequence similarity to ORF0657n and ORF0190. They were designed by taking into account the similarity and differences between native ORF0657n and ORF0190 protein similarity and differences between native ORF0657n and ORF0190 protein sequences. The invention also provides nucleic acids encoding these hybrid polypeptides, and a method for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides that diagnostic applications, such as being used to provide protective immunity against S. aureus infection, being used to provide protective immunity against S. aureus infection, being used to generate antibodies to detect the presence of S. aureus, and being used

  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABR72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC60510-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the Buropean Patent Office. The complete

The invention relates to novel protein complexes comprising a first and a second protein, or its derivative, fragment, homologue or variant. The proteins are selected from given protein complexes, which are not defined in the specification. The variants are encoded by nucleic acids that hybridize to the nucleic acids encoding the proteins under low stringency conditions. The protein complexes are useful as targets for an active agent of a pharmaceutical. These protein complexes are particularly useful as drugs targets for the treatment or preventing of a disease or disorder. The complexes and methods above are useful in diagnosing or screening for the presence of a disease or disorder or a predisposition for developing a disease or disorder in a subject. These are also useful in screening for a drug for treatment or prevention of a disease or disorder. The molecule that modulates the amount, activity or protein components of the complex is useful for the manufacture of a medicament of for the treatment or prevention of a disease.
                              New proteins and protein complexes from eukaryotes, useful as targets in

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant is such as maize or soybean. The method of producing a transformed plant cauch as maize or soybean. The method of producing a transformed plant cauch as migroved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plants with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme sements or orditions, pathogens or peets, increased resistance to plant disease, better growth rate by modification of the conlent, improved yield by modification of carbohydrate, increased rate of content, improved plant growth and development under at least one stress production, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form the print of the printed specification but was obtained in electronic

  The present invention relates to novel Streptococcus agalactiae nucleotide sequences (I; ADV87607-ADV87745) and novel polypeptides (II; ADV87646-ADV89550). The nucleotide sequences encode polypeptides of S. agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid phospholipid metabolism, nucleotide metabolism including purines, pyrimidinaes and/or nucleosides, regulatory functions, replication, translation, protein transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related to transposons, biosynthesis of cofactors, prosthetic groups and transporters, cell membrane protein and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaccutical composition comprising (I) or (II) are useful for

The present invention describes 23 human molecules for disease detection and treatment (MDDT-1 to 23) (see ABP55392 to ABP55414). The human MDDT-1 to 23 proteins of 10 are encoded by the sequences given in ABQ83859 to ABQ83891. (I) can have various activities depending on the cells and tissues in which they are expressed. These activities include: anti-HIV; anti-HIP and the Polymucle-Citides, and anta-HIP and the Polymucle-Citides, and anta-HIP and the HIP and the hip and anta-HIP and anta-HIP and HIP anti-HIP and HIP and HIP anti-HIP and HIP and HIP anti-HIP and HIP and HIP anti-HIP and HIP anti-HIP and HIP

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New vaccines comprising Sp128 or Sp130 polypeptides, for treating and preventing pareventing preventing preventing preventing preventing preventing preventing solvents, e.g. otitis media, nasopharyngeal, bronchial, lung or blood infections.

Claim 8; Page 51-54; 54pp; English

The invention relates to novel immunogenic polypeptides, Sp128 and Sp130 from S. pneumoniae. Vaccines comprising the polypeptides are useful for the treatment and prevention of pneumococcal infections, particularly infections caused by Streptococcus, such as cititis media, nasopharyngeal, bronchial, lung or blood infections. The antigens are used as immunogenic agents to stimulate an immune response. The antisera and antibodies may also be used in diagnosing and treating pneumococcal infections. Recombinant polypeptides serve as a mechanism for stimulating production of antibodies for use in passive immunotherapy, diagnostic reagents, and

  This sequence represents a Streptococcus pneumoniae protein of the invention. The proteins (or their homologues, derivatives and/or fragments) are useful as immunogens or antigens. Immunogento or antigenic compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or diagnostis of S. pneumoniae infection, by contacting a sample to be tested with them. Agents capable of antagonising, inhibiting or interfering with the function or expression of the protein or polypeptide are useful in medical compositions in the treatment or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, the be used to treat bacterial pneumonia, which has high rates in young children, the elderly, and in patients with predisposing conditions such as asplenia, heart, lung and kidney disease, diabetes, alcoholism,

  New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or ear infection.
   The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein. DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleocides 8-100 of a sequence not defined in the specification, for amplifying a target

the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the target sequence the target sequence, and where the parts of the primers having substantial complementary to the complement of the target sequence, and where the parts of the primers having substantial complementarity define the terminiof the target sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound binds to the protein and streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, uncleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus particularly S. pneumoniae, such as pneumonia, sepsis, otitis media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this patent did not form part of the printed separaticiatication, but was obtained in alectronic format directly from WIPO at fitp, wipo.int/pub/published_pct_sequences. (Updated on 23-OCT-2003 to standardise OS field)

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a product operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for cellular proliferation; (8) identifying a compound that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway required for proliferation, or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound a activity; (11) a culture comprising strains in which the gene compound a activity; (11) a culture comprising strains in which the extent compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for the all and proved that inhibits the confideration of an organism. The antisense nucleic acids are useful for confidentifying proteins or screening for homologous nucleic acids required for for expension of a compound that inhibits cellular proliferation of an organism. The antisense nucleic acids are useful for for expension of the compound that inhibits are serious uncleic acids required for an antisense and acide are useful for for expension and acceptance or the proliferation of an organism. The antisense mucleic acide are useful for an acceptance or the solution and acceptance or the proliferation or for an organism. 2002 ö screening 61 WEISGFEGKKDAGYVINLSKDTFIKPVFKKIEEKKGEBNKPTFDVSKKONPQVNHSQLN 120 drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the printed at the prin 9 1943 TTVKEPILNKDTGEVSELKPHRVTVTIQNGKEMSSTIVSEEDFILPVYKGELEKGYQFDG 1 TTVKEFILLNKDTGEVSELKPHRVTVTIQNGKEMSSTIVSEEDFILPVYKGELEKGYQPDG Gaps New antisense nucleic acids, useful for identifying proteins or e for homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs. ö 100.0%; Score 848; DB 6; Length 2140; 100.0%; Pred. This invention relates to novel nucleic acids encoding hyperimmune serum reactive antigens, or fragments derived thereof. Specifically, it refers to antigens selected from peptides and serum reactive epitopes that can be used in pharmaceutical compositions that exhibit antibacterial activity. The present invention describes a composition (including the nucleic acid molecule, hyperimmune serum-reactive antigen or antibody) that is useful for manufacturing a medicament such as a vaccine, which can be used to treat or prevent bacterial infections, particularly S. pneumoniae infections that cause pharyngitis, otitis media, pneumonia, bacteraemia sepsis and meningitis. The antigen or its fragment may also be used for isolating, purifying and/ or identifying an interaction partner of the hyperimmune serum reactive antigen, as well as for manufacturing a functional uncleic acid selected from aptemers and from the interaction at the interaction at incleic acid selected from spiegelmers or for manufacturing a functional ribonucleic acid selected from reactive antigen sequence is a Streptococcus pneumoniae hyperimmune serum reactive antigen

The invention relates to an isolated mucleic acid comprising a sequence encoding a Streptococcus pneumoniae ADR91366polypeptide, or its fragments, with any of 9 fully defined sequences (appearing as ADR9108, ADR94489, ADR94489, ADR94807, ADR94807, ADR94807, ADR94807, ADR94807, ADR95253, ADR95253, ADR95642, ADR95682, ADR96079) or any of the fully defined sequences appearing as ADR91705, ADR98486, ADR92197, ADR92234, ADR93039, ADR93079, ADR95366, ADR95680 or ADR986079) or at least 20 or 30 consecutive mucleotides, which is hybridisable under high stringency conditions to the nucleotide sequence. The nucleic acids and proteins are chosen from 5206 disclosed sequences. Also included are a recombinant expression vector comprising the isolated nucleic acid cited above operably linked to a transcription regulatory comprising at least 20 consecutive nucleotides of the present invention are useful for the diagnosis, prevention and/or treatment of sequences as cited above. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of Streptococcus pneumoniae e.g. pneumonia, meningitis and otitis media. The present sequence is one of the 2603 disclosed S. Streptococcus pneumoniae e.g. pneumonia, meningitis and otitis media. The present sequence is one of the 2603 disclosed S. Or pneumoniae protein sequences. Note: The sequence data for this patent did in clectronic format directly from USPTO at sequence abotained in electronic format directly from USPTO at sequence abotained in sequence. The 180074481.

The present sequence represents a protein from Streptococcus pneumoniae.
The nucleic acid sequence encoding the Streptococcus pneumoniae protein
can be useful in vaccines for inducing protective antibodies against
Streptococcus pneumoniae, for treatment or prevention of infection e.g.
pneumonia, otitis media or meningitis. Probes based on the nucleic acid
are used to detect Streptococcus infection (by usual hybridisation or
amplification methods), also for isolating Streptococcus genes or their
allelic variants. The protein can be used similarly to detect specific
antibodies in standard immunoassays, especially for diagnosing or
monitoring infections. Antibodies which bind the protein are used to
detect corresponding antigens, to purify the protein and for passive
immunisation (optionally coupled to a toxin). Vaccines are administered,
e.g. by injection, orally or through the skin, typically at 0.01-1000

The invention relates to an isolated polymucleotide consisting of a Streptococcus pneumoniae nucleic acid (appearing as ADG5122 and encoding SP028) one of 113 disclosed nucleic acids encoding 113 S. pneumoniae antigens. Also included are making a recombinant vector by inserting the nucleic acid into a vector, an isolated polymucleotide consisting of at least 50 or 100 contiguous nucleotides of the SP028 nucleic acid, and a recombinant host cell comprising the SP028 polymucleotide. The nucleic acids are useful as DNA vaccine against Streptococcus pneumoniae infection (e.g. pneumonia). Nucleic acids derived from the S. pneumoniae antigen nucleic acids are useful as probes for use in diagnostic methods for detecting S. pneumoniae gene expression. The present sequence represents an S. pneumoniae antigenic protein.

   ABQ84792 to ABQ84904 represents nucleic acids which encode the Streptococcus pneumoniae antigens given in ABP54557 to ABP54669. The S. preumoniae antigens have antibacterial activity and can be used in vaccines. The S. pneumoniae antigens can also be used to prevent or attenuate a Streptococcal infection in an animal. The polymucleotides encoding the S. pneumoniae antigens can be used to detect Streptococcus nucleic acids. ABQ84905 to ABQ85130 represent primers used in the cloning of S. pneumoniae ORPs (open readding frames) which are used in an example from the present invention
  New Streptococcus pneumoniae antigens, useful for detecting Streptococcus and for preventing or attenuating disease caused by Streptococcus

AAH52104 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81654 to AAG83120, from Staphylococcus epidermidis. (I) and have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) wia the production of vectors containing them which are used to produce hosts cells which express the bodypeptides (II) via the production of vectors containing polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to sasay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55091 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55091 complements from the present invention. AAH55091 to AAH55091 complement of the present invention. By The present in the sequence sequence listing of the present invention, however the sequence listing of the present specification, however the sequence in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present

  The present invention relates to the protection against malaria. More particularly, the invention pertains to a family of MSP-3-3 (merozoite surface protein 3)-like genes (MSP-3-1, MSP-3-3, MSP-3-3, MSP-3-3, MSP-3-4, MSP-3-5, MSP-3-6, MSP-3-7, and MSP-3-9) located on chromosome 10 of Plasmodium falciparum, highly conserved in P. falciparum strains, simultaneously expressed in P. falciparum at the erythrocytic stages and encoding proteins which have a Asn-Leu-Arg-Asn or Asn-Leu-Arg-Lys signature at their N-terminal extremity and which are located at the merozoite unface, The characterization of this gene family enables the definition of immunogenic and vaccine compositions against P. falciparum. The present sequence is the P. falciparum MSP-3-1 protein.

Tich protein (GLURP) moiety consisting of a polypeptide fragment (animo acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozoite aurface protein 3 (MSP3) moiety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises antibodies against both polypeptides in mice immunized with it. Also cartibodies against both polypeptides in mice immunized with it. Also cartibodies against both polypeptides in mice immunized with it. Also comprising the chimeric molecule of the invention bound to a solid support, (ii) an immunogenic composition comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or computation with a suitable vehicle, (iv) use of purified and/or companish malaria, and (v) a medicament for passive immunotherapy of malaria, and (v) a medicament for passive immunotherapy of malaria, and (v) a medicament for passive immunotherapy of malaria, and (v) a medicament for gasinst malaria. This sequence represents Plasmodium falciparum GLURP and MSP3 antigens are useful for the preparation of a vaccine composition against malaria. This sequence represents Plasmodium falciparum GLURP (27-S00)-MSP3 (212-380) fusion protein.

   The present invention relates to a fusion protein comprising Plasmodium falciparum glutemate-rich protein (GLURP) coupled to P. falciparum merozoite surface protein 3 (MSP3). The GLURP-MSP3 fusion protein is useful as an antigen based vaccine against malaria. Also disclosed is the polynucleotide sequence encoding the GLURP-MSP3 fusion protein. The polynucleotide sequence is also useful in preparing a vaccine. The vaccine is useful in treating and preventing malaria and for inducing an immune response against malaria. The present sequence represents P. falciparum GLURRP-MSP3 hybrid.

The invention relates a recombinant DNA construct comprising a polymucleotide having any of 5544 nucleotide sequences (CDNAs SEQ ID NO: 1-5544) and encoding a polympetide with any of 5544 amino acid sequences (SEQ ID NO: 5545-1088). The CDNAs and proteins are from corn, soybean, Arabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a plant a recombinant DNA construct comprising a promoter region functional in a plant call operably joined to a polymucleotide encoding a polympeptide associated with the property, and growing the transformed
   New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved biological characteristics.
and MSP3 antigens are useful for the preparation of a vaccine composition against malaria. This sequence represents Plasmodium falciparum MSP3a to MSP3f fragment. Note: The present sequence given as SEQ ID No:7 in the Sequence Listing is not mentioned elsewhere in the specification.

```
The present interaction describes process and the present interaction described are: (1) nucleotide sequences (II) encoding (1); and (2) accordes against P. falciparum infection comprising (I) or (II). (I) and (2) accordes against P. falciparum infection comprising (I) or (II). (II) are useful for the development of vaccines against P. falciparum (II) and polyclonal antibera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (sepecially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the plasmodium chromosome 2 and the subsequent identification of proteins canceded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and concoded by the subsequent identification of proteins concoded by it will help to expand our understanding of parasite resistance to provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide and protein sequences given in the present specification but which are not specifically mentioned within the

   The present invention relates to a method for identifying candidate proteins in pathogens useful as anti-infectives. The invention discloses a computational method which involves the calculation of several sequence attributes and their subsequence analysis results in the identification of outlier proteins in different pathogens. The method is useful for the identification of outlier proteins (e.g. virulence proteins, antigens or proteins used as drug targets) in pathogenic organisms. The method of the invention provides reproducible results as it does not depend on the variable biochemical characteriaation of proteins. AB023500-AB0233617 represent outlier proteins identified from different pathogenic organisms

The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) moiety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozoite curface protein 3 (MSP3) moiety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises antibodies against both polypeptides in mice immunized with it. Also chescribed are: (i) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (ii) an immunogenic composition comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or recombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a medicament against malaria, and (v) a medicament for passive malaria, comprising the anti-MSP3 and anti-GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP antibodies. The chimeric molecule of the invention of a vaccine composition against malaria. This sequence represents plasmodium falciparum MSP3 protein (amino acid residues 212-330).

The invention relates to an isolated mucleic acid comprising any one of the fall antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid mucleic acid; (2) a host cell containing the vector; (3) an isolated or uncleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway required for proliferation. Or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sectivity; (11) a culture comprising strains in which the gene or which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the conformance of an organism. The antisense nucleic acids are useful for dentifying proteins or some acide are useful for dentifying proteins or some sections or the section of an organism. The antisense mucleic acids are useful for dentifying the capacity or all solate candidate molecules for rational
  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
  drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at from it wipo.int/pub/published_pct_sequences

  capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB27072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

   The present invention describes 23 human molecules for disease detection and treatment (MDDT-1 to 23) (see ABP55392 to ABP55414). The human MDDT-1 to 23 proteins a crivities dequences given in ABQ83859 to ABQ83881. (I) can have various activities depending on the cells and tissues in which they are expressed. These activities include: anti-HIV; contailergic, antiinfarmatory; antiantamenic; antipartisonlam, noctropic; anticonvulsant; antiinfertility; antiarteriosclerotic; antiasthmatic; contidiabetic; nephrotropic; antigout; thyromimmetic; neuroprotective; contailabetic; nephrotropic; antigout; thyromimmetic; neuroprotective; coteopathic; antiatrhritic; antiherasitic; antiherasitic; antibacterial; coteopathic; ophthalmological; antirheumatic; haemostatic; antibacterial; coteopathic; ophthalmological; antirheumatic; haemostatic; antibacterial; coteopathic; phancoscacide; and the polymucleotides agonists conding them can be used in gene therapy. (I), polymucleotides, agonists conding them can be used in gene therapy. (I), polymucleotides, agonists conding them can be used in gene therapy. (I), polymucleotides, agonists conding them can be used in gene therapy. (I), polymucleotides, agonists conding or preventing disorders associated with abcraral expression of disorders, neurological disorders, reproductive disorders, or disorders, neurological disorders, reproductive disorders, or autoimmum/finifammatory disorders, or viral, bacterial, fungal.

Charasitic, protozoal or helminthic infections. They are also useful in the assessment of the effects of exogenous compounds on the expression of uncleic acid and amino acid sequences of proteins associated with MDDT

The present invention describes 23 human molecules for disease detection
and treatment (MDDT-1 to 23) (see ABP55392 to ABP55414). The human MDDT-1
cc to 23 proteins (I) are encoded by the sequences given in ABQB3B59 to
ABQB38B1. (I) can have various activities depending on the cells and
tissues in which they are expressed. These activities include: anti-HIV;
ct issues in which they are expressed. These activities include: anti-HIV;
cc antialpergic; antiinfertility; antiarteriosclerotic; antiasthmatic;
cn immunosuppressive; antithyroid; cytostatic; hepatotropic; dermatological;
antidiabetic; nephrotropic; antigatesitic; antihelminthic; antipacteriu;
corpathic; ophthalmological; antirheumatic; haemostatic; antibacterial;
cr virucide; protozoacide; and fungicide. (I) and the polymucleotides
cn coding them can be used in gene therapy. (I), polymucleotides, agonists
and antagonists from the present invention can be used for diagnosing,
cc recating or preventing disorders associated with aberrant expression of
MDDT, particularly cell proliferative (e.g. cancer), developmental
cd isorders, neurological disorders, or viral, bacterial; fungal,
parssitic, protozoal or helminthic infections. They are also useful in
the assessment of the effects of exogenous compounds on the expression of

The present sequence is that of a Staphylococcus aureus protein ORF0657n hybrid polypeptide. This is an example of claimed hybrid polypeptide the invention ADM88439-ADM88474 that comprise a modified S. aureus ORF0657n sequence ADM88431-ADM88478 containing amino acid substitutions that increase sequence similarity to ORF0190 ADM88432. The hybrid polypeptides contain one or more epitopes for ORF0657n and ORF0190 protein sequences. The convention also provides nucleic acids encoding these hybrid polypeptides, and a method for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to provide protective immunity against S. aureus infection, being used to generate antibodies to detect the presence of S. aureus, and being used to generate antibodies therapeutic antibodies that target S. aureus.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid nucleic acid (2) a host cell containing the vector; (3) an isolated or uncleic acid; (4) an antibody capable of specifically binding polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway or required for proliferation, (7) identifying a compound that inhibits poliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product itse or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiological; (10) profiling a compound sactivity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or objection of the strains is present in a culture or collection of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required

derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a vector comprising the novel polynucleotide sequence that is differentially regulated in an animal subjected to pain and a vector compression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound that regulates the activity of one or more of the polypeptides given in the specification, a method for identifying a compound that regulates the activity in an animal of one or more of the polypeptides or their antibodies. The polynucleotide or the compound that composition comprising the one or more polymetes its activity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the one or more pain (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. spinal segmental nerve injury (SNI)) in an animal end or the printed the sequence data for this patent did not form part of the printed the sequence data for this patent did not form part of the printed specification) which is differentially expressed during pain. Note:

The sequence data for this patent did not form are did not form or the component of the printed specification.

   The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal compound that regulates the activity of one or more of the expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more conducted sequence their antibodies. The polynucleotide or the compound that computed the sequence presented is a human protein (shown in Table 2 of the spay). The sequence presented is a human protein (shown in Table 2 of the sequence date for this patent did not form part of the printed the sequence date for this patent did not form part of the printed composition, but was obtained in electronic form directly from WIPO at fig. "XXXXXXXXXXII or the specification or presented computed or this patent did not form directly from WIPO at the patent and a patent or the sequence of the specification."

New vaccines comprising Sp128 or Sp130 polypeptides, for treating and preventing pneumococcal infections, particularly infections caused by Streptococcus, e.g. otitis media, nasopharyngeal, bronchial, lung or blood infections.

Claim 8; Page 51-54; 54pp; English.

The invention relates to novel immunogenic polypeptides, Sp128 and Sp130 from S. pneumoniae. Vaccines comprising the polypeptides are useful for the treatment and prevention of pneumococcal infections, particularly infections caused by Streptococcus, such as otitis media, nasopharyngeal, bronchial, lung or blood infections. The antigens are used as immunogenic agents to stimulate an immune response. The antisers and antibodies may also be used in diagnosing and treating pneumococcal infections. Recombinant polypeptides serve as a mechanism for stimulating production of antibodies for use in passive immunotherapy, diagnostic reagents, and

   This sequence represents a Streptococcus pneumoniae protein of the invention. The proteins (or their homologues, derivatives and/or fragments) are useful as immunogens or antigens. Immunogenic or antigenic compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or diagnosts of S. pneumoniae infection, by contacting a sample to be tested with them. Agents capable of anteaponising, inhibiting or interfering with the function or expression of the protein or polypeptide are useful in medical compositions in the treatment or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S, pneumoniae infection, the olderly, and in patients with predisposing conditions such as asplenia, heart, lung and kidney disease, diabetes, alcoholism,

1963 EDPILPVYKGELEKGYQPDGWEISGFEGKKDAGYVINLSKDTFIKPVFKKIEEKKEEENK 2022
  New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or ear infection.
   The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein. DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides 8-100 of a sequence not defined in the specification, for amplifying a target

sequence contained within a Streptococcus mucleic acid sequence, where
the first primer is substantially complementary to the target sequence
and the second primer is substantially complementary to the complement of
the target sequence, and where the parts of the primers having
the target sequence, and where the parts of the primers having
substantial complementarity define the termini of the target sequence to
be amplified, assay comprising contacting a test compound with the
protein, and determining whether the test compound binds to the protein
and a Streptococcus pneumoniae bacterium, where one or more genes
encoding the proteins has been rendered inactive. The proteins, nucleic
acid molecules, antibody and compositions are useful as medicaments for
treating or preventing a disease or infection due to streptococcus
bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, otitis
media or ear infection. They are also useful in developing vaccines,
diagnostics and antibiotics. The methods are useful for identifying
immunodominant proteins. The present sequence is one of the 2469 proteins
expressed by the identified coding regions from the genomic sequence.
Note: The sequence data for this patent did not form part of the printed
specification, but was obtained in electronic format directly from WIPO
at fip.wipo.int/pub/published_pct_sequences. (Updated on 23-OCT-2003 to

The invention relates to an isolated nucleic acid comprising any one of the dividence squences given in the specification where expression of the mucleic acid inhibites proliferation of a call. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid operation of a call. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid (2) an isolated oplypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibiting cellular proliferation or the acidity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, or that inhibits cellular proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (6) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the testrains or streaming for machine compound that inhibits the product is overexpressed or underexpressed; (12) determining the extent of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for proliferation to isolate candiate molecules for rational drug discovery programs, or for screening for homologous nucleic acids required for proliferation to isolate candiate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation to isolate candiate molecules for rational drug discovery programs, or for screening for molecules for exional dr

This invention relates to novel nucleic acids encoding hyperimmune serum reactive antigens, or fragments derived thereof. Specifically, it refers to antigens selected from peptides and serum reactive epitopse that can be used in pharmaceutical compositions that exhibit antibacterial activity. The present invention describes a composition (including the nucleic acid molecule, hyperimmune serum-reactive antigen or antibody) that is useful for manufacturing a medicament such as a vaccine, which can be used to treat or prevent bacterial infections, particularly S. pneumoniae infections that cause pharyagitis, ottiis media, pneumonia, bactersemia sepsis and meningitis. The antigen or its fragment may also be used for isolating, purifying and/ or identifying an interaction partner of the hyperimmune serum reactive antigen, as well as for manufacturing a functional nucleic acid selected from appears and selected from the propriet antigen of from ribozymes, antisense nucleic acids and askna. This polypeptide sequence is a streptococcus pneumoniae hyperimmune serum reactive antigen

The present sequence represents a protein from Streptococcus pneumoniae.

The nucleic acid sequence encoding the Streptococcus pneumoniae protein

can be useful in vaccines for inducing protective antibodies against
Streptococcus pneumoniae, for treatment or prevention of infection e.g.

pneumonia, otitis media or meningitis. Probes based on the nucleic acid

are used to detect Streptococcus infection (by usual hybridisation or

amplification methods), also for isolating Streptococcus genes or their

albelic variants. The protein can be used similarly to detect specific

antibodies in standard immunossays, especially for diagnosing or

monitoring infections. Antibodies which bind the protein are used to

detect corresponding antigens, to purify the protein and for passive

immunisation (optionally coupled to a toxin). Vaccines are administered,

e.g. by injection, orally or through the skin, typically at 0.01-1000

   The invention relates to an isolated polynucleotide consisting of a Streptococcus pneumoniae nucleic acid (appearing as ADC45122 and encoding SP028) one of 113 disclosed nucleic acid encoding 113 S. pneumoniae antigens. Also included are making a recombinant vector by inserting the nucleic acid into a vector, an isolated polynucleotide consisting of at least 50 or 100 contiguous nucleotides of the SP028 nucleic acid, and a recombinant host cell comprising the SP028 polynucleotide. The nucleic acids are useful as DNA vaccine against Streptococcus pneumoniae infection (e.g. pneumonia). Nucleic acids derived from the S. pneumoniae antigen nucleic acids are useful as probes for use in diagnostic methods for detecting S. pneumoniae agene expression. The present sequence

The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) molety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozoite unrelate protein 3 (MSP3) molety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises artibodies against both polypeptides in mice immunised with it. Also described are: (i) a conjugate comprising the chimeric molecule of the invention bound to a solid support. (ii) an immunogenic composition composition to a solid support, (ii) an immunogenic composition comparising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine against malaria comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or recombinant anti-MSP3 and anti-GLURP antibodies. for the preparation of a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or incedicament against malaria, and (v) a medicament for passive of GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP and MSP3 antigens are useful for the preparation of a vaccine composition against malaria. This sequence represents plasmodium falciparum MSP3a to MSP3 fragment. Note: The present sequence given as SEQ ID No:7 in the Sequence Listing is not mentioned elsewhere in the specification.

   The present invention relates to the protection against malaria. More particularly, the invention pertains to a family of MSP-3 (merozoite surface protein 3)-like genes (MSP-3-1, MSP-3-2, MSP-3-3, MSP-3-3, MSP-3-6, MSP-3-6, MSP-3-7 and MSP-3-8) located on chromosome 10 of Plasmodium falciparum, highly conserved in P. falciparum strains, simultaneously expressed in P. falciparum at the erythrocytic stages and encoding proteins which have a Asn-Leu-Arg-Asn or Asn-leu-Arg-Lys signature at their N-terminal extremity and which are located at the merozoite their N-terminal axacterization of this gene family enables the definition of immunogenic and vaccine compositions against P. falciparum. The present sequence is the P. falciparum MSP-3-1 protein.

   Chimeric molecule useful for preparing vaccine composition against malaria, comprises glutamate-rich protein GLURP and Merozoite surface protein 3 MSP3 moieties, and raises antibodies against moieties in mice immunized with molecule.
   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), and the encoded proteins (ABBS7737-ABB27072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) moiety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozoite surface protein 3 (MSP3) moiety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises antibodies against both polypeptides in mice immunized with it. Also checribed are: (i) a conjugate comprising the chimeric molecule of the invention bound to a solid support. (ii) an immunogenic composition comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen; (iii) a vaccine above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or recombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a medicament against malaria, comprising the anti-MSP3 and anti-GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP and MSP3 antigens are useful for the preparation of a sufficence represents plasmodium falciparum MSP3 comprising protein (amino acid residues 212-380).

The present invention relates to a fusion protein comprising Plasmodium falciparum glutamate-rich protein (GLURP) coupled to P. falciparum morzozite surface protein 3 (MSR9). The GLURP-MSP3 fusion protein is useful as an antigen based vaccine against malaria. Also disclosed is the polynucleotide sequence encoding the GLURP-MSP3 fusion protein. The polynucleotide sequence is also useful in preparing a vaccine. The vaccine is useful in treating and preventing malaria and for inducing an immune response against malaria. The present sequence represents P. falciparum GLURP-MSP3 hybrid.

7;
   by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (1) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II) and (2) implection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum Purthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecyle, and
  provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification

  proteins in pathogens useful as anti-infectives. The invention discloses a computational method which involves the calculation of several sequence attributes and their subsequence analysis results in the identification of outlier proteins in different pathogens. The method is useful for the identification of outlier proteins (e.g. virulence proteins, antigens or proteins used as drug targets) in pathogenic organisms. The method of the invention provides reproducible results as it does not depend on the variable blochemical characterisation of proteins. ABO23500-ABO23617 represent outlier proteins identified from different pathogenic organisms

   The invention relates to the isolation of novel genes (ACF34446-ACF34559) encoding proteins (ABR64180-ABR64281) involved in the process of angiogenesis. The nucleic acid molecules are useful in identifying and/or obtaining full-length human genes involved in an angiogenic process. The nucleic acid molecule, polypeptides or complexes encoded, cells or genetically modified non-human animals derived from these are useful for the screening of candidate pharmaceutical compounds used in treating angiogenesis-related disorders. They are also useful for diagnosing, prognosticating or treating an angiogenesis-related disorder, which involves uncontrolled or enhanced angiogenesis or is a disorder in which a decreased vasculature is of benefit (e.g. cancer, rheumatoid arthritis, diabetic retinopathy, psoriasis or cardiovascular diseases such as a disorder in which a majogenesis or is a disorder in which a majogenesis or is a disorder in which an expanding vasculature is of benefit (e.g. ischemic limb disease or coronary artery disease). The

ä,
specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymuclectide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
  The invention relates to a combination comprising cDNAs that are differentially expressed in response to steroid treatment. Also included are the following: a high throughput method for using a cDNA to detect differential expression of nucleic acids in a sample; and a high throughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA. The sample is from a subject with wilson disease and comparison of a standard defines a stage of that disease. The high throughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA comprises: combining the combination with molecules or compounds under conditions to allow

   The invention relates a recombinant DNA construct comprising a polymucleotide having any of 5544 nucleotide sequences (CDNAs SEQ ID NO: 1-5544) and encoding a polymetide with any of 5544 amino acid sequences (CRQ ID NO: 5545-11088). The CDNAs and proteins are from corn, soybean, Arabidopsis, wheat and rape but the specification does not indicate which esquences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising a promoter region continuous and plant with the property and growing the transformed plant. The property is selected from improving plant cold tolerance, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for improving plant drought tolerance, for providing increased resistance to plant disease, for galactomannan production, for production cold plant tolerance to hard growing plant tolerance to hard galactomannan production, for improving cold improving plant tolerance to herbicides, for improving the rate of homologous recombination in plants, for lignin production, for improving
  a;
   New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved biological characteristics.

cc plant tolerance to extreme osmotic conditions, for improving plant
cc tolerance to pathogens or pests, for yield improvement by modification of
cc photosynthesis, for modifying seed oil yield and/or content, for
modification of carbohydrate, nitrogen or phosphorus use and/or uptake
cc modification of carbohydrate, nitrogen or phosphorus use and/or uptake
and for yield improvement by providing improved plant growth and
cdevelopment under at least one stress condition. The polymucleotide may
also encode a plant transcription factor. The methods and compositions of
the present invention are useful in the field of biochemistry and
cc genetics, in particular for producing transgenic plants with improved
cc plotaic characteristics such as increased yield, improved nitrogen
cc biological characteristics such as increased yield, improving plant
cc tolerance to extreme osmotic and dicought conditions, and improving plant
ct tolerance to plant pests or pathogens. They can also be used in physical
arrays of molecules, plant breeding markers, computer-based storage and
carrays of molecules, plant breeding markers, computer-based storage and
analysis systems. The present sequence is one of the 5544 plant protein
cc analysis systems of the printed specification, but was obtained in
cc electronic format directly from USPTO at
corrected to the printed specification, but was obtained in
cc sequence.

```
The present sequence is that of a staphylococcus aureus protein ORF0657n hybrid polypeptide. This is an example of claimed hybrid polypeptide. This is an example of claimed hybrid polypeptide. The state of the invention ADW88433-ADW88443 that comprise a modified S. substitutions that increase sequence similarity to ORF0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORF0657n and Cafferences between native ORF0190 protein sequences. The invention also provides nucleic acids encoding these hybrid polypeptides, on an enchod for evaluating the ability of an immunosen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to provide protective immunity against S. aureus infection, being used to generate antibodies to therapeutic antibodies that target S. aureus.
  Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine;

frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pheumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae. (Updated on 17-2003 to standardise OS field)

   The present sequence is that of a Staphylococcus aureus protein ORF0657n hybrid polypeptide denoted 0657niybrid3. This is an example of claimed hybrid polypeptide immunogens of the invention ADW88439-ADW88474 that comprise a modified S. aureus ORF0657n sequence ADW88433-ADW88434 containing amino acid substitutions that increase sequence similarity to ORF0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORF0657n and ORF0190. They were designed by taking into account the similarity and differences between native ORF0657n and ORF0190 protein similarity and differences between native ORF0657n and ORF0190 protein hybrid polypeptides, and a method for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus

2
  The invention relates to constructing (MI) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (MI) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal gent, an antifungal
   nnstructing strains for identifying gene products as effective targets or therapeutic intervention, by inactivating in the strain one allele of gene and placing other allele of the gene under conditional expression.

and for identifying a therapeutic agent for treatment of a mammalian activity of a useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, translational, signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of an essential Candida albicans protein used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to berwent by
  the European Patent Office

Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

Claim 8; SEQ ID NO 15383; 2537pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the

```
complementary strand of a polymuclectide which comprises a 5'-and sequence and an oligonuclectide comprising a sequence complementary to the sequence and an oligonuclectide corprising a sequence, where the polymuclectide which comprises a 1'-end sequence, where the oligonuclectide which comprises a 1'-end sequence, where the oligonuclectide which comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be useful for synthesising polymucleotides, capticularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs assily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH13632 represent human amino acid sequences; and AAH3629 to AAH13632 represent coligonucleotides, all of which are used in the exemplification of the

```
The invention relates to a novel isolated polynucleotide comprising any of the 87 sequences fully defined in the specification or its mature protein-coding portion. The polynucleotide of the invention demonstrates neuroprotective, nootropic, crebroprotective and antiparkinsonian activities whilst the polynucleotides, polypeptides and compounds may be useful for treating neurological conditions including spinal cord injury, cranial or cerebral trauma, stroke, Alzehimer's disease, anxiety, autism, Parkinson's disease, tardive dyskinesia, paralysis, seizures or memory disorders. The current sequence is that of the protein of the invention.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Claim 8; Page 51-54; 54pp; English.

The invention relates to novel immunogenic polypeptides, Sp128 and Sp130 from S. pneumoniae. Vaccines comprising the polypeptides are useful for the treatment and prevention of pneumococcal infections, particularly infections caused by Streptococcus, such as cititis media, nasopharyngeal, bronchial, lung or blood infections. The antigens are used as immunogenic agents to stimulate an immune response. The antisera and antibodies may also be used in diagnosing and treating pneumococcal infections. Recombinant polypeptides serve as a mechanism for stimulating production of antibodies for use in passive immunotherapy, diagnostic reagents, and

   This sequence represents a Streptococcus pneumoniae protein of the invention. The proteins (or their homologues, derivatives and/or fragments) are useful as immunogens or antigens. Immunogenic or antigenic compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or diagnostic assays. The sequences are useful for the detection or diagnosts of S. pneumoniae infection, by contacting a sample to be tested with them. Agents capable of antagnosis, inhibiting or interfering with the function or expression of the protein or polypeptide are useful in medical compositions in the treatment or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, the subsence of the protein or prophylaxis of S. pneumoniae they can be used to treat bacterial pneumonia, which has high rates in young children, the elderly, and in patients with predisposing conditions such as asplenia, heart, lung and kidney disease, diabetes, alcoholism,

   New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or
   The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleocides 8-100 of a sequence not defined in the specification, for amplifying a target

sequence contained within a Streptococcus nucleic acid sequence, where
the first primer is substantially complementary to the target sequence
and the second primer is substantially complementary to the complement of
the target sequence, and where the parts of the primers having
the target sequence, and where the parts of the primers having
substantial complementarity define the termini of the target sequence to
be amplified, assay comprising contacting a test compound with the
protein, and determining whether the test compound binds to the protein
and a Streptococcus pneumoniae bacterium, where one or more genes
encoding the proteins has been rendered inactive. The proteins, nucleic
acid molecules, antibody and compositions are useful as medicaments for
treating or preventing a disease or infection due to streptococcus
bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, otitis
media or ear infection. They are also useful in developing vaccines,
diagnostics and antibiotics. The methods are useful for identifying
immunodominant proteins. The present sequence is one of the 2469 proteins
expressed by the identified coding regions from the genomic sequence.
Note: The sequence data for this patent did not form part of the printed
specification, but was obtained in electronic format directly from WIPO
at fip.wipo.int/pub/published\_pct\_sequences. (Updated on 23-OCT-2003 to 8888888888888888888888888888888

This invention relates to novel nucleic acids encoding hyperimmune serum reactive antigens, or fragments derived thereof. Specifically, it refers to antigens selected from peptides and serum reactive epitopse that can be used in pharmaceutical compositions that exhibit antibacterial activity. The present invention describes a composition (including the nucleic acid molecule, hyperimmune serum-reactive antigen or antibody) that is useful for manufacturing a medicament such as a vaccine, which can be used to treat or prevent barterial infections, particularly S. Dactersamia sepais and meningitis. The antigen or its fragment may also be used for isolating, purifying and/ or identifying an interaction partner of the hyperimmune serum reactive antigen, as well as for manufacturing a functional nucleic acid selected from aptamers and from the interaction acid selected from standards antigen seguence is a Streptococcus pneumoniae hyperimmune serum reactive antigen sequence is a Streptococcus pneumoniae hyperimmune serum reactive antigen

The invention relates to an isolated nucleic acid molecule for detecting, preventing or treating pathological conditions resulting from bacterial confrection. The isolated nucleic acid comprises: (a) any of the 2603 mulcotide sequences of ARA57336 to ARA67819; (b) a nucleotide sequence of ARA57336; (c) a nucleotide sequences of ARA57339; (d) a nucleotide sequence of at least 8 nucleotides in length, where the sequence is hybridizable to a nucleid acid having any of the nucleotide sequence is equence of at least 8 nucleotides in length, where the sequence is hybridizable to a nucleid acid having any of the nucleotide sequence of a). Also described: (l) a recombinant expression vector comprising the above nucleic acid operably linked to a transcription regulatory element; (2) a cell comprising the recombinant expression vector; (3) producing an consisting of at least 8 nucleotides of any of ARA57336 to ARA57389; (5) treating a subject for 8. pneumoniae polypeptide sequence consisting of at least 8 nucleotides of any of ARA57336 to ARA57389; (5) treating a subject for 8. pneumoniae infection; (6) a recombinant or comparising nucleotide or its sequence of infection, comprising an amount of the above nucleic acid or polypeptide; (7) a vaccine composition of an 8. pneumoniae acid or polypeptide; (9) a computer readable medium having recorded the nucleotide sequences of ARA57838; (10) a computer based system for identifying c fragments of the Streptococcus genome of commercial importance. The composition and methods are useful for diagnosing, preventing or treating c patent invention. Note - The sequence data for this patent did not form the part of the printed specification, but was obtained in electronic format directly from the negation.

Nucleic acid encoding antigenic peptide(s) from Streptococcus pneumoniae - or their epitope-containing fragments, useful in protective or therapeutic vaccines, and for diagnosis.
  The present sequence encoding the Streptococcus pneumoniae protein can be useful in vaccines for inducing protective antibodies against can be useful in vaccines for inducing protective antibodies against streptococcus pneumoniae, for treatment or prevention of infection e.g. pneumonia, oitis media or meningitis. Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000
   The present sequence represents a protein from Streptococcus pneumoniae

The invention relates to an isolated polynucleotide consisting of a Streptococcus pneumoniae nucleic acid (appearing as ADC45122 and encoding SP028) one of 113 disclosed nucleic acids encoding 113 S. pneumoniae antigens. Also included are making a recombinant vector by inserting the nucleic acid into a vector, an isolated polynucleotide consisting of at least 50 or 100 contiguous nucleotides of the SP028 nucleic acid, and a recombinant host cell comprising the SP028 polynucleotide. The nucleic acids are useful as DNA vaccine against Streptococcus pneumoniae infection (e.g. pneumonia). Nucleic acids derived from the S. pneumoniae antigen nucleic acids are useful as probes for use in diagnostic methods for detecting S. pneumoniae gene expression. The present sequence represents an S. pneumoniae antigenic protein.
   Novel polynucleotide encoding Streptococcus pneumoniae polypeptides useful for producing vaccines for prevention or attenuation of infection by Streptococcus pneumoniae.

  New Streptococcus pneumoniae antigens, useful for detecting Streptococcus and for preventing or attenuating disease caused by Streptococcus infection.
   ABQ84792 to ABQ84904 represents nucleic acids which encode the Streptococcus pneumoniae antigens given in ABP54557 to ABP54669. The S. pneumoniae antigens have antibacterial activity and can be used in vaccines. The S. pneumoniae antigens can also be used to prevent or attenuate a Streptococcal infection in an animal. The polymucleotides encoding the S. pneumoniae antigens can be used to detect Streptococcus nucleic acids. ABQ84905 to ABQ85130 represent primers used in the cloning of S. pneumoniae ORPs (open reading frames) which are used in an example from the present invention

The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) molety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozoite surface protein 3 (MSP3) molety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises artibodies against both polypeptides in mice immunized with it. Also described are: (i) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (ii) an immunogenic composition of comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine against malaria comprising the chimeric molecule, the conjugate described and/or comprising the suitable vehicle, (iv) use of purified and/or recombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a mixture of GLURP and MSP3 antigons as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or recombinant anti-MSP3 and (v) a medicament for passive comprising the anti-MSP3 and anti-GLURP comprising the anti-MSP3 and antigons are useful for the preparation of a waxture of GLURP and MSP3 antigons are useful for the preparation of a vaccine composition against malaria. This sequence represents Plasmodium falciparum MSP3 at the Sequence represents Plasmodium falciparum MSP3 at the Sequence represents Plasmodium falciparum MSP3 at the Sequence represents plasmodium falciparum MSP3 at the Sequence represents in the specification.

  54 IKPVPKKIEBEKKEB------ENKPTFDVSKKDNPQVNHSQLNESHRKEDLQR 100
   The present invention relates to the protection against malaria. More particularly, the invention pertains to a family of MSP-3 (merozoite surface protein 3)-like genes (MSP-3-1, MSP-3-3, MSP-3-3-3, MSP-3-4, MSP-3-5, MSP-3-6, MSP-3-6, MSP-3-7 and MSP-3-8) located on chromosome 10 of Plasmodium falciparum, highly conserved in P. falciparum strains, simultaneously proteins which have a Asn-Leu-Arg-Asn or Asn-Leu-Arg-Lys signature at their N-terminal extremity and which are located at the merozoite surface. The characterization of finis gene family enables the definition of immunogenic and vaccine compositions against P. falciparum. The present sequence is the P. falciparum MSP-3-1 protein.
   P. falciparum merozoite surface protein 3, amino acid residues 212-380.

The present invention relates to a fusion protein comprising Plasmodium falciparum glutamate-rich protein (GLURP) coupled to P. falciparum merozoite surface protein 3 (MSP3). The GLURP-MSP3 fusion protein is useful as an antigen based vaccine against malaria. Also disclosed is the polymucleotide sequence encoding the GLURP-MSP3 fusion protein. The polymucleotide sequence is also useful in preparing a vaccine. The vaccine is useful in treating and preventing malaria and for inducing an immune response against malaria. The present sequence represents P.

  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA aequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

proteins in pathogens useful as anti-infectives. The invention discloses a computational method which involves the calculation of several sequence attributes and their subsequence analysis results in the identification of outlier proteins in different pathogens. The method is useful for the identification of outlier proteins (e.g. virulence proteins, antigens or proteins used as drug targets) in pathogenic organisms. The method of the invention provides reproducible results as it does not depend on the variable biochemical characterisation of proteins. AB023500-AB0235017 represent outlier proteins identified from different pathogenic organisms

(BION-) BIONOMICS LTD

Claim 15; SEQ ID NO 216; 90pp; English.

The invention relates to the isolation of novel genes (ACF3446-ACF34559) encoding proteins (ABR64180-ABR64281) involved in the process of anglogenesis. The nucleic acid molecules are useful in identifying and/or obtaining full-length human genes involved in an anglogenic process. The nucleic acid molecule, polypeptides or complexes encoded, cells or genetically modified non-human animals derived from these are useful for the acreening of candidate pharmaceulcal compounds used in treating anglogenesis-related disorders. They are also useful for diagnosing, prognosticating or treating an anglogenesis-related disorder, which involves uncontrolled or enhanced anglogenesis or is a disorder in which a decreased vasculature is of benefit (e.g. cancer, rheumatoid arthritis, diabetic retinopathy, psoriasis or cardiovascular diseases such as atherosclerosis), or involves inappropriately arrested or decreased anglogenesis or is a disorder in which an expanding vasculature is of benefit (e.g. ischemic limb disease or coronary artery disease). The modulator of expression or activity of the polypeptide encoded by the treatment of an anglogenesis-related disorder. This sequence corresponds to one of the novel anglogenic protein

   The invention discloses a composition comprising two or more isolated rate or human polymucleotides or a polymucleotide which represents a fragment, and an allelic variation of the mucleic acid sequence. Also classified are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a ckit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence the expression of a polymucleotide sequence which is differentially expression of a polymucleotide sequence which is differentially expression of a polymucleotide sequence which is differentially expression of a polymucleotide sequence which is differentially expression of a polymucleotide sequence which is differentially expression of a polymucleotide sequence which is differentially expression of the compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polympetides or their antibodies. The polymucleotide or the compound that composition comprising the one or more pain and a pharmaceutical composition comprising the one or more polymented its activity is useful for preparing a medicament for treating pain (e.g. spinal sequence presented is a human protein (shown in Table 2 of therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note:

The sequence date for this patent did not form part of the printed presented to the specification but was obtained in electronic form directly from WIPO at

The invention relates to a combination comprising cDNAs that are differentially expressed in response to steroid treatment. Also included are the following: a high throughput method for using a cDNA to detect differential expression of nucleic acids in a sample; and a high troughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA. The sample is from a subject with Wilson disease and comparison of a standard defines a stage of that disease. The high throughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA comprises: combining to identify a ligand that specifically binds a cDNA comprises to allow specific binding; and detecting specific binding between each cDNA and at least one molecule or compound. The molecules or compounds are regulatory composition for proteins. The combination is useful for preparing a composition for treating liver disorders associated with steroid therapy, e.g., cirrhosis or hepatitis. The present sequence represents a human protein which is differentially expressed in steroid-induced CDA liver cells. Note: The

This invention relates to the novel association of protein sequences (and the genes which encode them) to the NP-kappaB pathway. The invention may be useful for the production of compounds with an antiinflammatory, cytostatic, hepatotropic, virucide, antiarthritic, antiinflammatory, cytostatic, hepatotropic, virucide, antiarteriosclerotic, antiinflammatory, cytostatic, antiarteriosclerotic, immunoadulacor, cerebroprotective, vasotropic, immunosuppressive or vilnerary activity or for gene therapy. The proteins and nucleotides are useful for diagnosing, preventing, treating, or ameliorating conditions or diseases associated with the NP-kappaB pathway. The condition is an immune disorder, an inflammatory disorder, an inflammatory disorder, an inflammatory disorder calated to aberrant NP-kappaB regulation, cancer, aberrant apoptosis, related to aberrant NP-kappaB regulation, cancer, aberrant apoptosis, syndromes, hypohidrotic ectodermal dysplasia, X-linked anhidrotic ectodermal dysplasia, immunodeficiency, viral infections, HIV-1, HTLV-1, evasion of immune responses, rheumatoid arthritis, inflammatory bowel disease, colitis, asthma, atherosclerosis, cachexia, euthyyoid sick syndrome, stroke, RAB, autoimmune disorders, disorders related to aberrant acute phase responses, hypercongentical conditions, birth defecte, necrotic lesions, wounds, organ transplant
   rejection, disorders related to aberrant signal transduction, proliferating disorders, cancers and HIV propagation in cells infected with other viruses. The present sequence is that of a human protein which is subject to the novel association with the NP-kappaB pathway of the invention. Note: This sequence does not appear in the specification but was obtained by the indexer from Genbank.

  The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal crivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular width markers and as a food pupplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abbarrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for generation of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at (II) will published_pot_essences

The invention relates to a novel isolated nucleic acid molecule encoding a fibrinogen-binding polypeptide or its fragment, or an adhesion factor or its fragment. The invention further comprises: a vector comprising the above nucleic acid molecule; a cell, preferably a host cell, comprising the above nucleic acid molecule; a process for producing polypeptide or an adhesion factor, comprising an amino acid sequence encoded by the above nucleic acid molecule; a process for producing the above compresses the polypeptide or its fragment; a process for producing the above polypeptide or its fragment; a pharmaceutical composition, especially a vaccine, comprising the polypeptide or its fragment, or the above nucleic acid molecule; an antibody, or its part, that binds to at least a selective part of the polypeptide or its fragment; methods for identifying an antagonist capable of reducing or inhibiting the activity of the polypeptide or its fragment capable of binding to the polypeptide or its fragment capable of conting the interaction of the polypeptide or its fragment to its interaction partner; an antagonist identified by the above method; processes for in vitro capable of a disease related to the expression of the advance or infection, or a disease related to the expression of the advance or infection, or a disease related to the expression of the advance or infection.
   Dolypeptide or its fragment; and an affinity device comprising a support material and immobilized to the support material the above polypeptide or its fragment; and an affinity device comprising a support material and immobilized to the support material the above polypeptide or nucleic acid molecule. The fulciple acid says polypeptide by the nucleic acids may be used in gene therapy to treat disorders. The nucleic acid is used for manufacturing or generating functional ribonucleic acids selected from ribozymes, antisense nucleic acids and siRNA. The polypeptide for its fragment is useful for manufacturing a medicament, especially a vaccine against bacterial infection. The polypeptide is also used for manufacturing an antibody that may be used for manufacturing a medicament for treating or preventing bacterial infections, especially 8. agalactiae infections. The polypeptide is also used as an antigen, or for isolating, purifying and/or identifying an interaction partner of the polypeptide or its fragment, or for generating a peptide binding to the polypeptide, such as a functional nucleic acid selected from aptamers and spiegelmers. This sequence represents a fibrinogen-binding polypeptide of the invention.
New nucleic acid molecules and encoded adhesion factors and/or fibrinogen -binding polypeptides for diagnosing, preventing or treating bacterial infections, preferably Streptococcus agalactiae infection.

   The present invention relates to novel Streptococcus agalactiae

nucleotide sequences (1; ADV87607-ADV87745) and novel polypeptides (II;
ADV87764-ADV89520). The nucleotide sequences encode polypeptides of S.
apulativate. Description in the synthesis of amino acids, cell membranes,
intermediate (central) metabolism, energetic metabolism, fatty acid and
galactiae involved in the synthesis of amino acids, cell membranes,
intermediate (central) metabolism, energetic metabolism, fatty acid and
phospholipid metabolism, nucleotide metabolism including purines,
pyrimidines and/or nucleosides, regulatory functions, replication,
transportion, translation, protein transport, adaptation to atypical
conditions, sensitivity to medicines and/or analogues, functions related
transporters, cell membrane proteins and cellular machinery. (I) are
useful for the detection and/or amplification of nucleic acids.
Cueful for the detection and/or amplification of nucleic acids.
Transporters, cell membrane proteins and cellular machinery. (I) are
useful for the detection and/or amplification of nucleic acids.
Transment of a bacterial S. agalactiae infection. Note: W020022818A2 is
equivalent for the present basic patent FR2824074A1. W020022818A2
contains 6617 sequence whereas the present patent only contains 2344

The invention relates a recombinant DNA construct comprising a polymetrian relates a recombinant DNA construct comprising a polymetrian relates a recombinant DNA construct comprising a plant where and proteins are from corn, soybean, arabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a conduction and in a plant call operably joined to a polymucleotide encoding a collypeptide associated with the property and growing the transformed plant. The property is selected from improving plant cold tolerance, for manipulating growth rate in plant cells by modification of the cell cycle plant. The property is selected from improving plant tolerance to plant disease, for galactomannan production, for production for improving plant tolerance to hand plant about the property in plant drought tolerance, for providing increased compination in plants, for improving plant tolerance to enther parts, for improving plant tolerance to enther property in plant drought tolerance, for increasing the rate of improving plant tolerance to enther property in plant growth regulators, for improving plant tolerance to bardogens or peers, for ingreving plant tolerance to be plant displants, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to be protein yield and/or content, for modification of carbohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and for yield improvement by providing improved plants with improved development under at least one stress condition. The methods and compositions of the present invention are useful in the field of biochemistry and genetics, in particular for producing transgenic plants with improving plant tolerance to extreme osmotic and drought conditions, and improving plant tolerance to plant peers or pathogens to cond or plant in particular plant p
New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved biological characteristics.
  The invention relates a recombinant DNA construct comprising a

The present sequence is that of a Staphylococcus aureus protein ORF0657n hybrid polypeptide. This is an example of claimed hybrid polypeptide immunogens of the invortion ADW88433-ADW88441 that comprise a modified S. cureus ORF0657n sequence ADW88433 containing amino acid substitutions that increase sequence similarity to ORF0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORF0657n and differences between native ORF0657n and ORF0190 protein sequences. The invention also provides nucleic acids encoding these hybrid polypeptides, on a method for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to generate antibodies to detect the presence of S. aureus, and being used to generate antibodies to therapeutic antibodies that target S. aureus.
                     70 KPTPDVSKKKON-----SHRKEDLQREEHS 104
   Novel hybrid polypeptide immunogen comprising modified ORF0657n sequence, useful for inducing protective immune response in humans against Staphylococcus aureus infection.

  April 24, 2006, 14:41:16; Search time 87.4631 Seconds (without alignments) 1161.588 Million cell updates/sec
  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
   US-10-067-385-8_COPY_630_773

1: pir3:\* 2 E 4

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
